## Color codes for emergency exit doors

Why color codes for emergency exit doors? There are enough visual signs to recognize an emergency door no? That's true, but it's not only about recognizing an emergency door, what also matters to me (and it should to you!) is in what condition the emergency door is when you need to use it!

By condition I mean: is the door open? Locked? Blocked? Electrical opening in case of emergency? Key necessary? Consequently, I find it useful to think of a simple system to determine the exact condition of each emergency exit door. This system should be adapted each time there is a condition change for any emergency exit door.

How to?

An overview of the complete set of emergency exit doors - *with their respective condition* - should be at the disposal of the entire staff - if not at least the security staff – at the appropriate location in your company e.g. dispatching, refectory, dressing room....

It should be checked/adapted at least once a day by qualified personnel depending on the conditions at that moment.

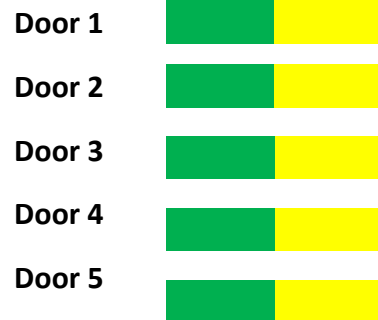

It should be applied to both sides of the emergency door as low as possible in a format/size that is visible up to at least 10 meters in normal conditions.

Don't forget that even in a short time span conditions can change, e.g. a museum or school isn't open all day, so you have to adapt the color codes consequently.

### Example

**Open to the public 8:00 am – 7:00 pm**

**Closed to the public 7:00 pm – 8:00 am**

This is just one of the possibilities, you can adapt the information that you add to the original color code definition, depending on the requirements in your company.

By this I mean NOT changing the original definition of the color code!
